

r2 Debugger Improvements

Zi Fan Tan (abcSup)

About me

- Undergraduate student from Malaysia
- Computer Science major
- Enjoy reverse engineering software and games
- Started contributing to radare2 this year

GSoC 2020

- r2 Debugger Improvements
 - Reverse Debugging
 - WinDbg KDNet Support
- Mentors - yossizap, Florian Märkl

Reverse Debugging

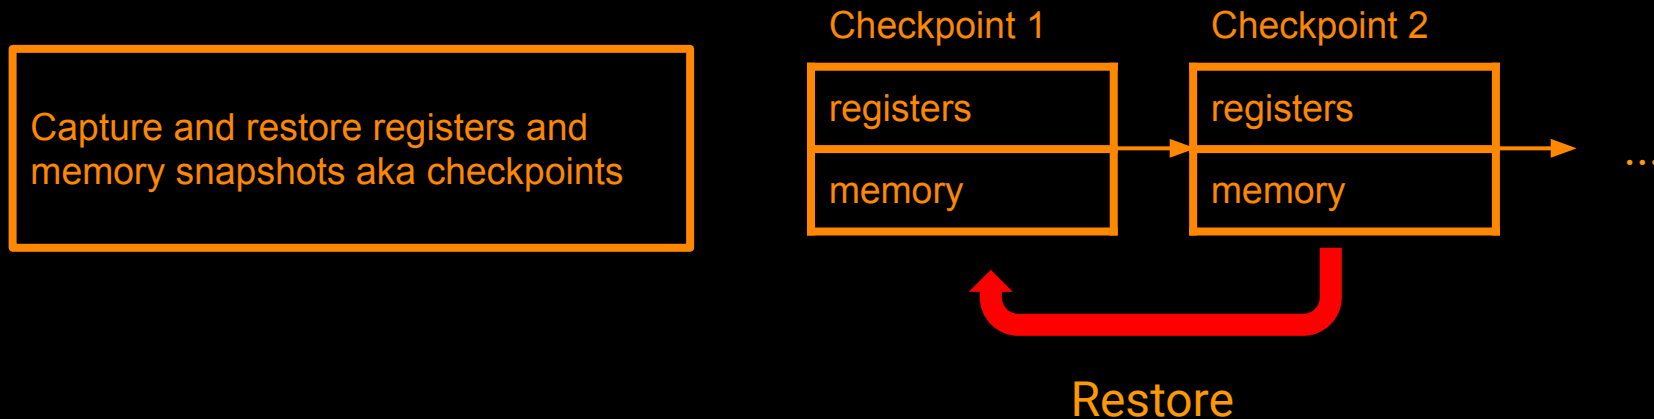

Reverse Debugging

- The ability to “reverse” program executions
- Impossible on hardware
- Use software to keep track of previous states
- View program states and control flow in history

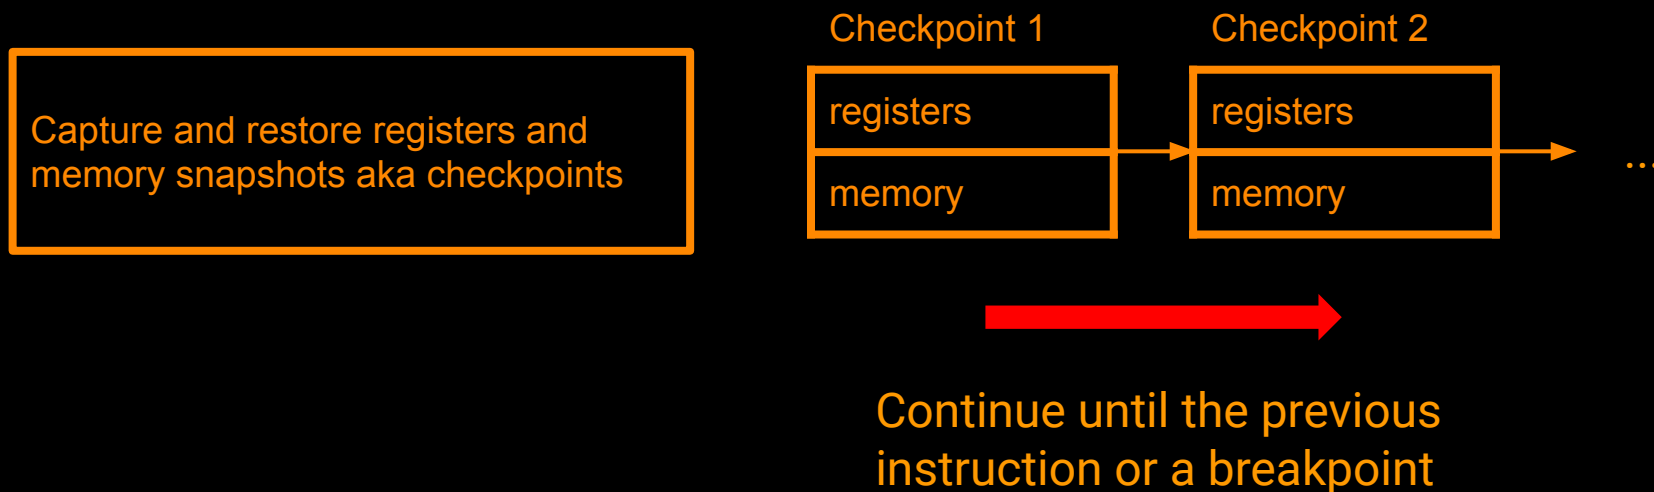

Reverse Debugging - Implementation

Reverse Debugging - Implementation

Reverse Debugging - Implementation

Reverse Debugging - Implementation

- Hard to track the previous PC value after JMP

Reverse Debugging - Implementation

Capture and restore registers and memory snapshots aka checkpoints

Checkpoint 1

registers

memory

Checkpoint 2

registers

memory

...

Trace registers and memory changes with index and apply them accordingly

Changes

rax

cnum	data
...	...
118	0xabc

0x7fffffff20

cnum	data
...	...
119	0xabc

...

Reverse Debugging - Implementation

During Execution

- Record **registers** and **memory** changes at every executed instruction

```
118 mov rax, 0xabc
119 mov dword [ rbp - 4 ], rax
```

rax

cnum	data
...	...
118	0xabc

0x7fffffffdf20

cnum	data
...	...
119	0xabc

Reverse Debugging - Implementation

Step/Continue Back

- Look up the previous PC value or the latest PC value that hits a breakpoint.

118 mov rax, 0xabc

119 mov dword [rbp - 4], rax

PC

cnum	data
...	...
118	0x555555554605
119	0x55555555460c

R240N 0 2 0 2 0

Reverse Debugging - Implementation

Step/Continue Back

- Apply latest **registers** and **memory** changes before that index (e.g. `cnum = 118`)

→ 118 `mov rax, 0xabc`
119 `mov dword [rbp - 4], rax`

rax

cnum	data
...	...
114	0x1234
118	0xabc

0x7ffffffdf20

cnum	data
...	...
115	0x0
119	0xabc

other registers
and memory...

Reverse Debugging - Usage

- Support x86 and ESIL (WIP)
- Commands
 - Start and stop session - dts+, dts-
 - Step and continue back - dsb, dcb
 - Save and load session - dtst, dtsf
- Config
 - dbg.trace_continue - Trace every instruction when continuing

Reverse Debugging - Usage

dbg.trace_continue

-e dbg.trace_continue=true (default)

```

;-- main:
;-- rax:
;-- rip:
0x555555554617 55      push rbp
0x555555554618 4889e5   mov rbp, rsp
0x55555555461b e8daffff call sym.foo ;[1]
0x555555554620 b b800000000 mov eax, 0
0x555555554625 5d      pop rbp
0x555555554626 c3      ret

```

dc

```

;-- foo:
0x5555555545fa 55      push rbp
0x5555555545fb 4889e5   mov rbp, rsp
0x5555555545fe c745fc000000 mov dword [rbp - 4], 0
0x555555554605 eb04     jmp 0x55555555460b
0x555555554607 8345fc01 add dword [rbp - 4], 1
0x55555555460b 817dfc9f8601 cmp dword [rbp - 4], 0x1869f
0x555555554612 7ef3     jle 0x555555554607
0x555555554614 90      nop
0x555555554615 5d      pop rbp
0x555555554616 c3      ret

```

-e dbg.trace_continue=false

```

;-- main:
;-- rax:
;-- rip:
0x555555554617 55      push rbp
0x555555554618 4889e5   mov rbp, rsp
0x55555555461b e8daffff call sym.foo ;[1]
0x555555554620 b b800000000 mov eax, 0
0x555555554625 5d      pop rbp
0x555555554626 c3      ret

```

dc

- Trace every instruction along the way

- Take a registers and memory snapshot at the next debugger stop (e.g. breakpoint)

Demo

Reverse Debugging - Future improvements

- Dynamic taint analysis
- Integration with r2 Project
- System calls emulation (read, write, mmap, ...)

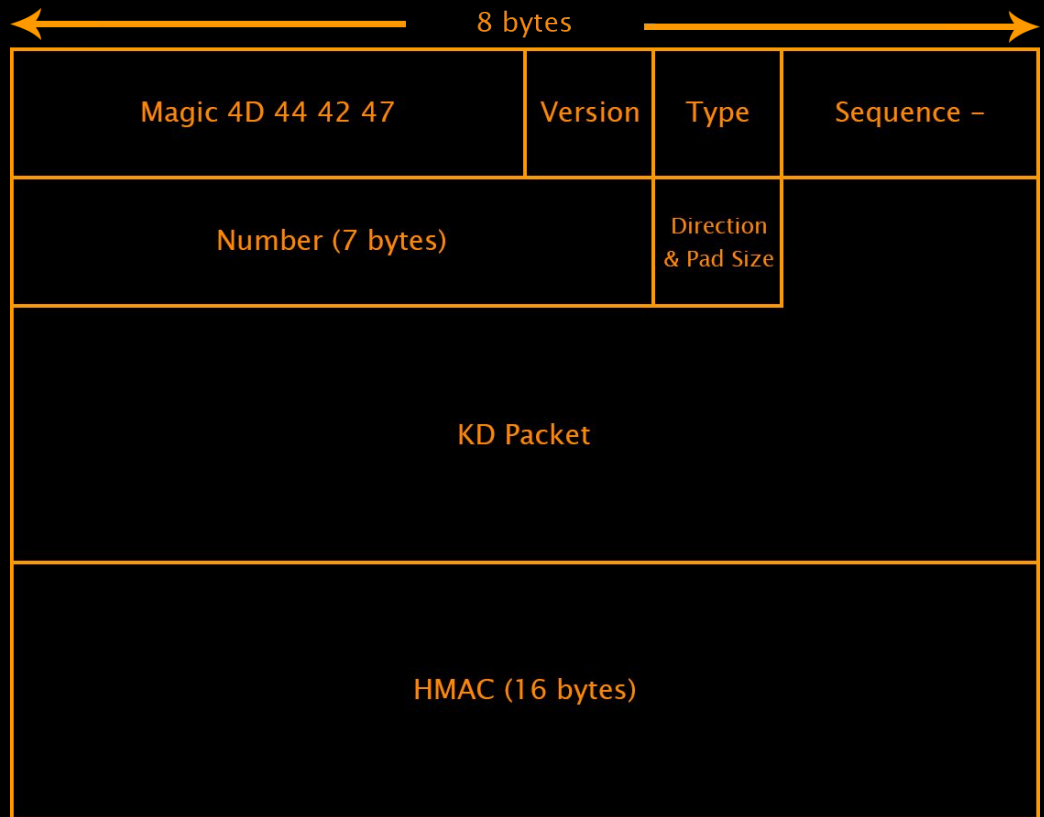

WinDbg KDN Net Support

WinDbg KDNNet Support

- Debug Windows kernel over network
- Replace serial connections, similarly to VirtualKD
- KD packets wrapped in UDP packets
- Implementation can be found by analyzing DbgEng.dll

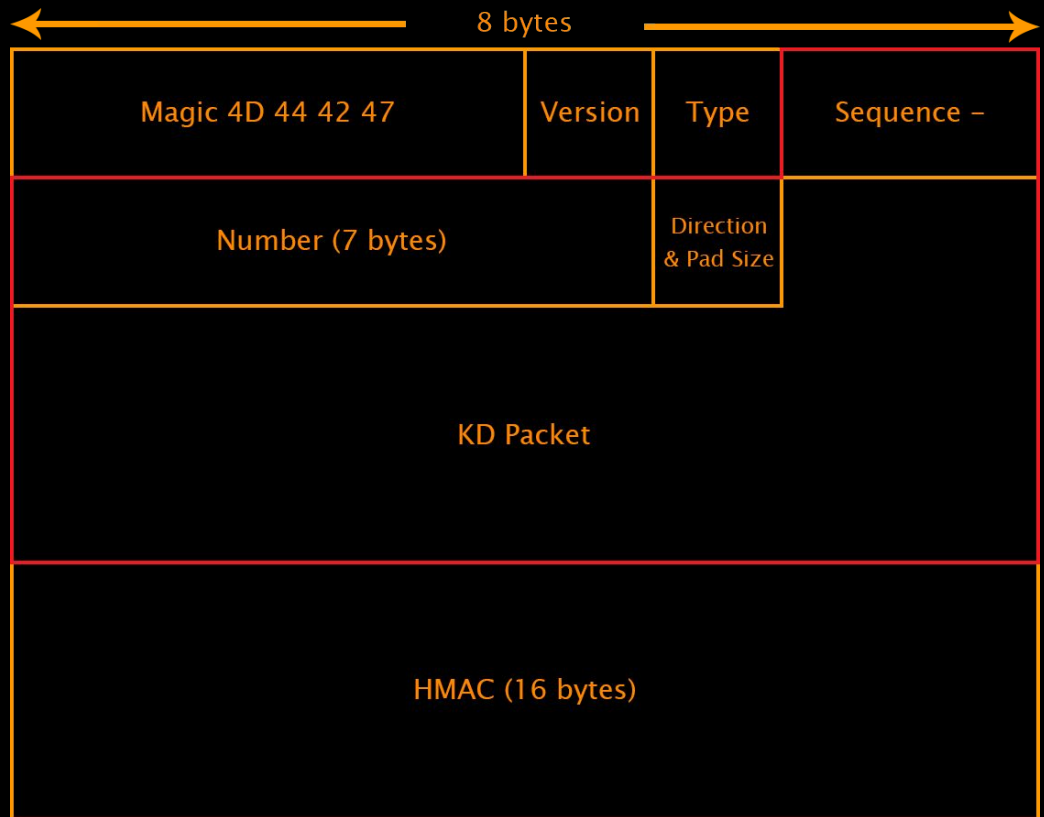

WinDbg KDNNet Support - Packet structure

- KDNNet Header
 - Magic, Version, Type
- KDNNet Data
 - Sequence Number
 - Direction (first bit)
 - Pad size (last 7 bits)
 - KD Packet
- HMAC

WinDbg KDNNet Support - Packet structure

- KD Packet
 - 16-byte aligned
- KDNNet Data
 - encrypted with AES256
 - used to generate
SHA256HMAC
(first 16 bytes are used)

WinDbg KDN Net Support - Usage

- Easier to setup compared to serial ports on VM

Setting up on Windows

```
C:\ bcdedit /debug on
```

```
C:\ bcdedit /dbgsettings net <hostip>:w.x.y.z port:<hostport>
```

Connecting to KDN Net on r2

```
$ r2 -a x86 -b 64 -d winkd://<targetip>:<hostport>:w.x.y.z
```

DbgEng - WinDbg Backend

Credits to @GustavoLCR

DbgEng - WinDbg Backend

- Provide API to execute the same functions as WinDbg commands
- New windbg:// IO and Debug handler using DbgEng.dll*
- Debug programs, crash dump files (.dmp), remote target and KD
- Same command-line parameters when using WinDbg.exe

C:\ radare2 -d "windbg://notepad.exe"

C:\ radare2 -d "windbg://-k net:port=<hostport>,key=<w.x.y.z>"

C:\ radare2 -d "windbg://-z file.dmp"

* Previous KD interface has been renamed to winkd://

Credits to @GustavoLCR

DbgEng - WinDbg Backend

- Direct access to WinDbg backend shell (!)

```
[0x7ffa3e8ece30]>=!k
